Title

Step 12 of 12

Dash Components

Objectives

After completing the lab you will be able to:

- Know how to add multiple graphs to the dashboard
 Work with Dash Callbacks to handle multiple outputs
- Estimated time needed: 30 minutes

Dataset Used

About Skills Network Cloud IDE

This Stills Network Labs Cloud IDE (Integrated Development Environment) provides a hands-on environment in your web proves for completing course and project related labs. It stillness Thesia, an open-source IDE platform, that can be run on desktop or on the cloud. So far in the course you have been using Jupyter motebooks to run your python code. In this IDE provides an alternative for entiting and running your python code. In this IDE provides an alternative for entiting and running your python code. In this IDE provides an alternative for entiting and running your python code. In this IDE provides an alternative for entities and insuling your Desk and publications.

Flight Delay Time Statistics

Important Notice about this lab environment

Please be aware that sessions for this lab environment are not persisted. When you launch the Cloud IDE, you are presented with a 'dedicated computer on the cloud' exclusively for you. This is available to you as long as you are actively working on the labs.

Once you close your session or it is timed out due to inactivity, you are logged off, and this 'dedicated computer on the cloud' is deleted along with any files you may have created, dowloaded or installed. The next time you launch this lab, a new environment is created for you fit you finish only part of the lab and return later, you may have to start from the beginning. So, it is a good idea to plan to your time accordingly and finish your labs in a single session.

Let's start creating dash application

Analyze flight delays in a dashboard.

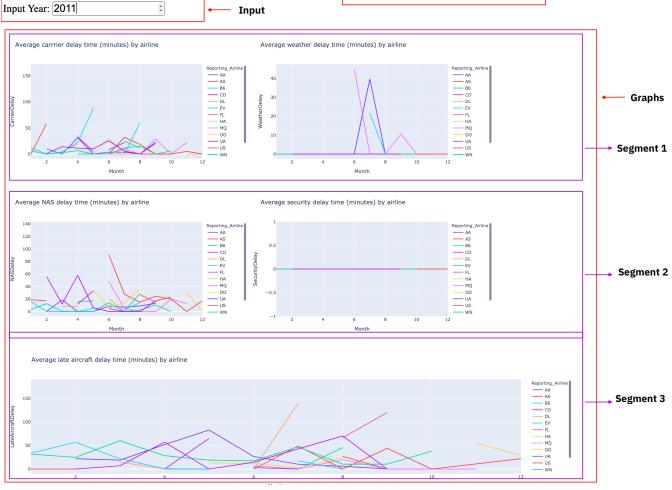

Dashboard Components

- NOTE: Year range should be between 2010 and 2020

Expected Output

Below is the expected result from the lab. Our dashboard application consists of three co

- Title of the application
 Component to enter input year
 Component to enter input year
 Control with the control of the control

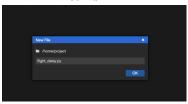

Get the tool ready

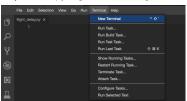

Install python packages required to run the application. Copy and paste the below command to the terminal.
 python3 -a pip install padas dash

16/2/23, 17:39 1 de 4

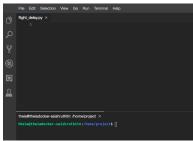

• Provide the file name as flight_details.py

Now, you have script and terminal ready to start the lab

TASK 1 - Read the data

Importing necessary libraries
 Reading the data

Copy the below code to the rlight_delay.py script and review the code.

Import required libraries import pandas as pd import plotly graph objects as go import dash import dash html components as html import dash core components as dcc from dash.Goognedencies import Imput, Output import plotly.express as px.

import plotty.express as px
Read tha altrine data into pandas dataframe
airline_data = pd.read_cov(https://cf.cowres-data.s3.us.cloud-object-stor
dtype-(SulvAirport': str, "SulvTailNum': str,
"SulvAirport': str, "SulvTailNum': str);
SulvAirport': sr, "SulvTailNum': str)

TASK 2 - Create dash application and get the layout skeleton

- Title of the application
 Component to enter input year inside a layout division
 That's conveying the different types of flight delay

Mapping to the respective Dash HTML tags:

• Title added using stat. It() tag
• Layout division added using stat. Stv() and input component added using scc. Layout () tag inside the layout division.
• C sharts split into three segments. Each segment has a layout division added using stat. Stv() and chart added using scc. Graph() tag inside the layout division.

Copy the below code to the rtigat_sclap_op_script and review the structure.

NOTE: Copy below the current code

Create a dash application app = dash.Dash(_name_)

16/2/23, 17:39 2 de 4

```
html.Div(, style={'width':'65%'})
])
    TASK 3 - Update layout components

    Update dcc_Input component id as input-year, default value as 2016, and type as number. Use style parameter and assign height of the input box to be 35px and font-size to be 38

    Output component - Segment 1
    Segment \ 1 \ is \ the \ first \ \texttt{html.0iv}(). \ We \ have \ two \ inner \ division \ where \ first \ two \ graphs \ will \ be \ placed.
  html.Div([
html.Div(),
html.Div()
], style={'display': 'flex'}),
    First inner division

    Add dcc.Graph() component.
    Update dcc.Graph component id as carrier-plot.

    Second inner division

    Add dcc.Graph() component.
    Update dcc.Graph component id as weather-plot.

    Output component - Segment 2
     Segment 2 is the second html.Div(). We have two inner division where the next two graphs will be placed
 html.Div([
html.Div(),
html.Div()
l. style=['display': 'flex'}),
    First inner division

    Add dcc.Graph() component.
    Update dcc.Graph component id as nas-plot.

     Second inner division

    Add dcc.Graph() component.
    Update dcc.Graph component id as security-plot.

    Output component - Segment 3

    Add dcc.Graph() component to the first inner division.
    Update dcc.Graph component id as late-plot.

    TASK 4 - Review and add supporting function
    Below is the function that gets input year and data, perform computation for creating charts and plots
    Copy the below code to the rlight_delay.py script and review the structure
    NOTE: Copy below the current code
    This function takes in airline data and selected year as an input and performs computation for creating charts and plots
    Arguments:
    Sirline data: Input airline data.
    entered_year: Input year for which computation needs to be performed.
    Raturns:
Computed average dataframes for carrier delay, weather delay, RMS delay, security delay, and late aircraft delay
            Computes infoliations data, entered year):
# Salect Ends.
# Salect
    TASK 5 - Add the application callback function
    The core idea of this application is to get year as user input and update the dashboard in real-time. We will be using callback function for the same

    Define the callback decorator
    Define the callback function that uses the input provided to perform the computation
    Create graph and return it as an output
    Run the application
    Copy the below code to the rlight_delay.py script and review the structure
    # Callback decorator (Supp.callback) [ Output(component_id='carrier-plot', component_property='figure'),
    l, Input(....))
# Computation to callback function and return graph def get_graph(entered_year):
             # Compute required information for creating graph from the data avg_car, avg_weather, avg_NAS, avg_sec, avg_late = compute_info(airline_data, entered_year)
            ang.cr., ang wester, ang MES, ang.ec. ang Lite - compute infoiritine, data, entered year) a

dai
                                 [carrier_fig, weather_fig, mas_fig, sec_fig, late_fig]
    TASK 6 - Update the callback function
    Callback decorator
           * Refer examples provided have:

**We have 5 output components added in a list. Update output component id parameter with the ids provided in the ec. Graph() component and set the component property as rispre. One sample has been added to the skeleton

**Update input component id parameter with the id provided in the ecc. Input() component property as value.
    Callback function
     Next is to update the get_graph function. We have already added a function compute_into that will perform computation on the data using the input
    Mapping the returned value from the function <code>compute_info</code> to graph:

    avg_car - input for carrier delay
    avg_weather - input for weather delay
    avg_MAS - input for NAS delay
    avg_sec - input for security delay
    avg_tate - input for late aircraft delay

    Refer to the full code of 4.8 Flight Delay Time Statistics Dashboard.py
    ** Import required libraries import pandas as pt import dash html components as html import dash html components as html import dash ntml corponents as dcc from dash. dependencies import input, output import pash; express as pt.
    # Create a dash application app = dash.Dash(_name_)
# Create & dails Septimentum general part of the control of the co
     This function takes in airline data and se

 ***Callback Function
Function that returns fugures using the provided input year.
List of rights version for a claim of second property figure; compound property figure; compound
 Input(component id-'input-year', component property-'value'))
# Computation to Callback function and return graph
def get_graph(entered_year):
            # Compute required information for creating graph from the data avg_car, avg_weather, avg_MAS, avg_sec, avg_late = compute_info(airline_data, entered_year)
          # Run the app
if __name__ == '__main__':
app_run server()
 TASK 6 - Run the application

    Observe the port number shown in the terminal.

                                             ocker-saishruthitn:/home/project$ python dash_basics.py
ing on http://127.0.6.1:8850/

    Debug mode: off
    Running or http://127.0.0.1:8050/ (Press CTRL+C to quit)

         \bullet Click on the Launch Application option from the side menu bar. Provide the port number and click ox
                                                             Launch Your Application
                                                                           Application Port
8050
 The app will open in a new browser tab like below
                                                                                                                                                                                                                                                                                                                                                           Flight Delay Time Statistics
 Input Year: 2013
 Congratulations, you have successfully created your dash application!
 Exercise : Practice Tasks
 You will practice some tasks to update the dashboard.
                                Change the title to the dashboard from "Flight Delay Time Statistics" to "Flight Details Statistics Dashboard" using HTML H1 component and font-size as 35.
                               Save the above changes and rename file as rtight_dotails.pyand relaunch the dashboard application to see the updated dashboard title.
